**THERAPEUTIC APPLICATIONS FOR THE  
ANTI-T-BAM (CD40-L) MONOCLONAL ANTIBODY 5c8**

10 **Abstract of the Disclosure**

Activation of cells bearing CD40 on their cell surface by CD40 ligand is inhibited by contacting the cells with an agent capable of inhibiting interaction between CD40  
15 ligand and the cells, in an amount effective to inhibit activation of the cells. Activation of cells bearing CD40 on their surface by CD40 ligand in a subject is inhibited by administering to the subject an agent capable of inhibiting interaction between CD40 ligand and  
20 the cells, in an amount effective to inhibit activation of the cells. Conditions dependent on CD40 ligand-induced activation of CD40-bearing cells are treated.
